Programmers Guide

APPLICATION TYPE

- Java Web Application

DESIGN

- MVC

  - Model
    - Java classes located in src/Components. Each model class
      represents a database table or component within
      the application. Each model has a factory that communicates
      with different DAO objects in order to populate given class properties.

  - View
    - JSP files located in the WebContent folder. Each file
      contains <div> tags that are dynamically rewritten
      using data from the model objects.

  - Controller
    - Java servlets located in src/Servlets handle requests from the user
      (via view) and call model factories in order to get data.
